Build hacking  
tools

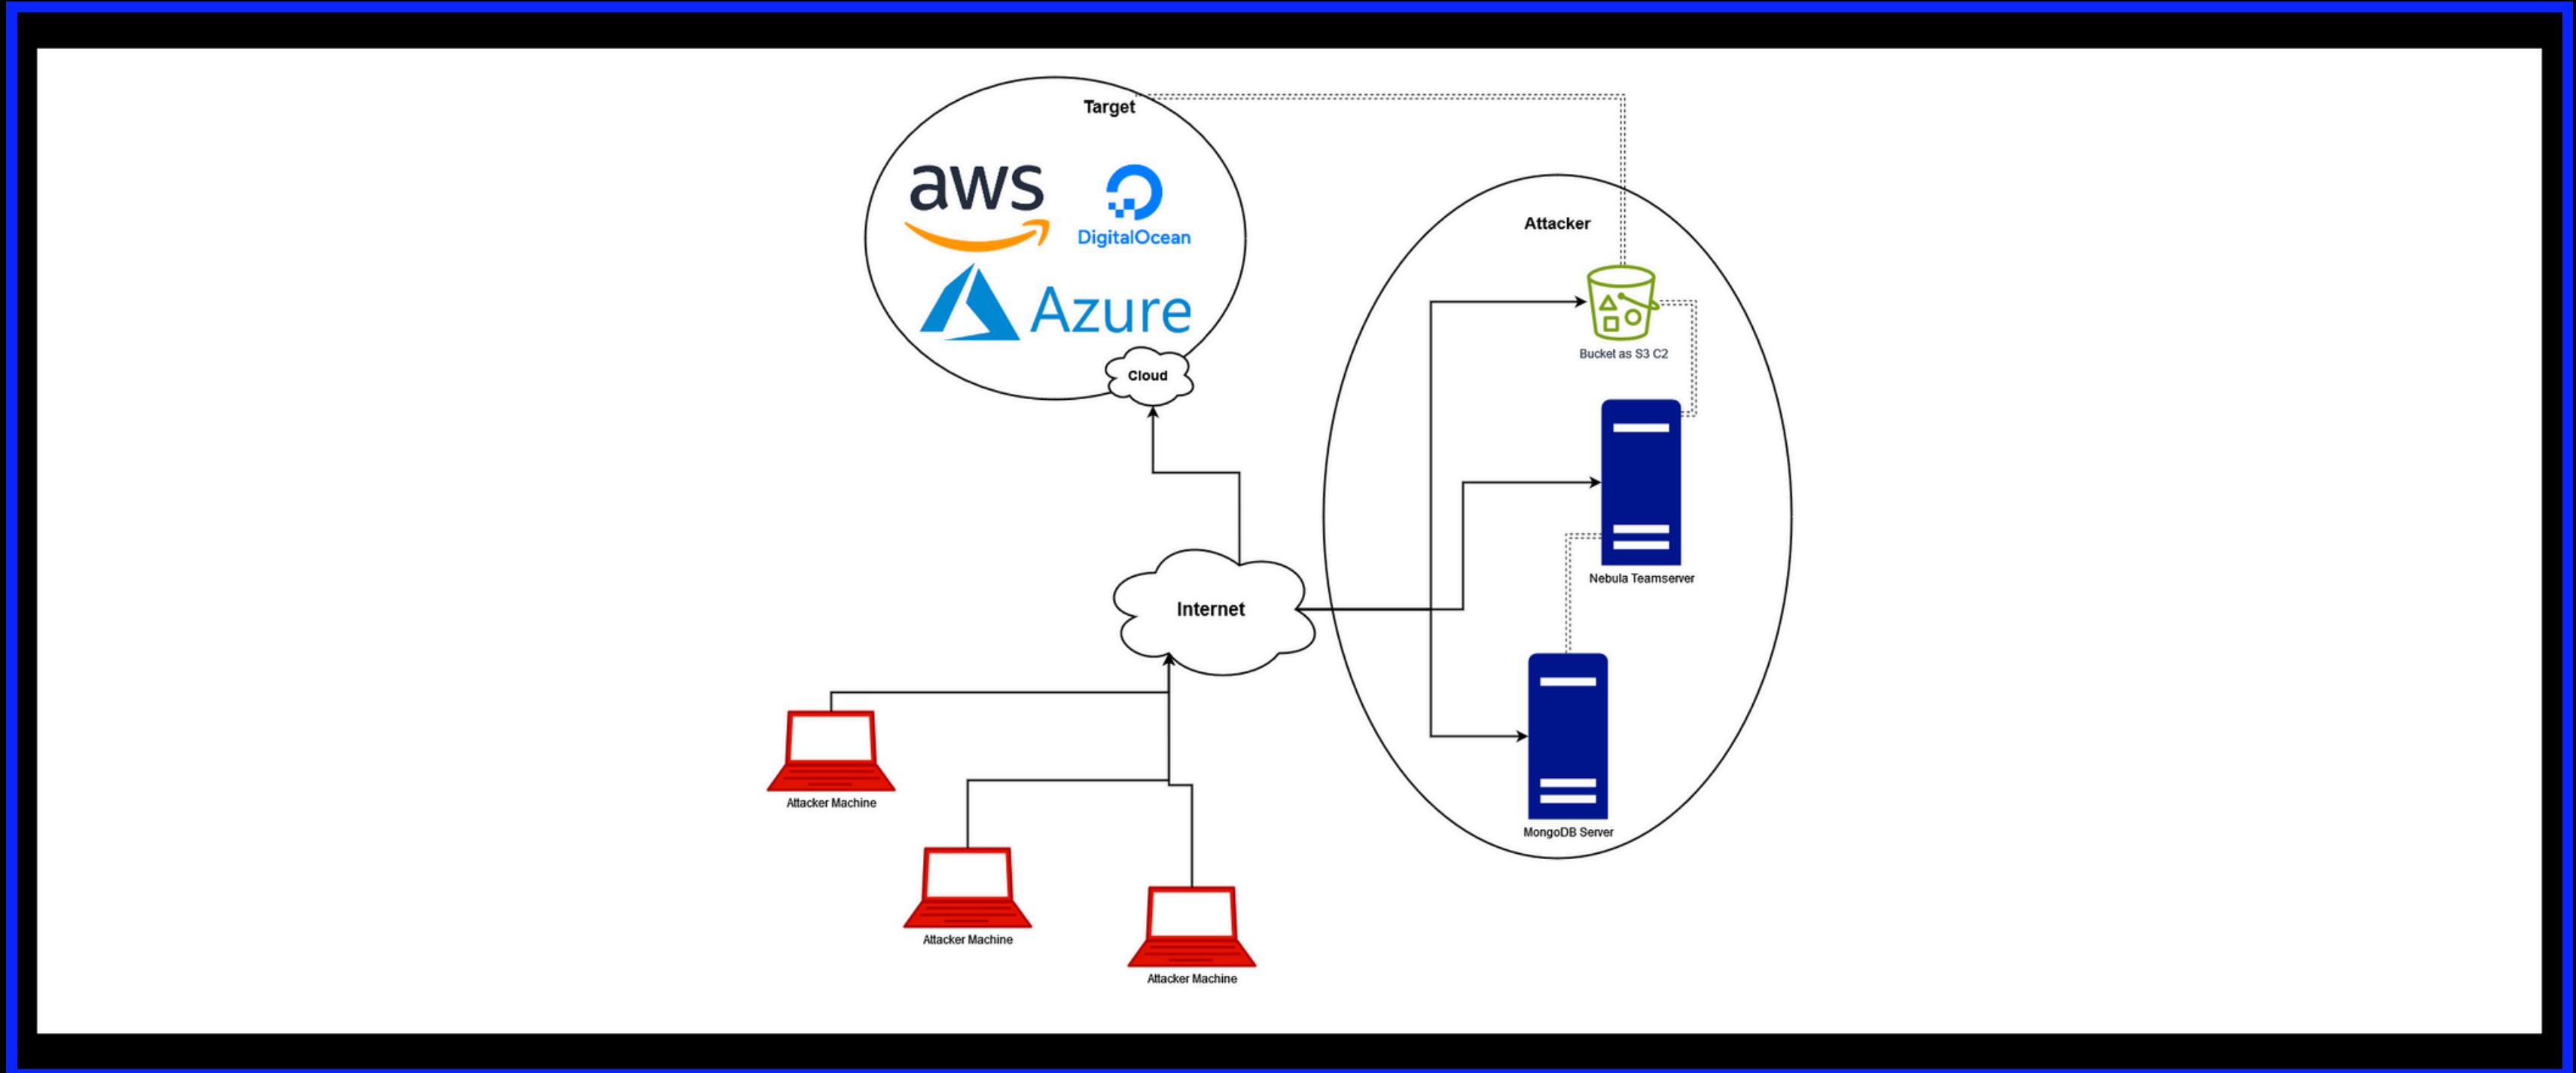

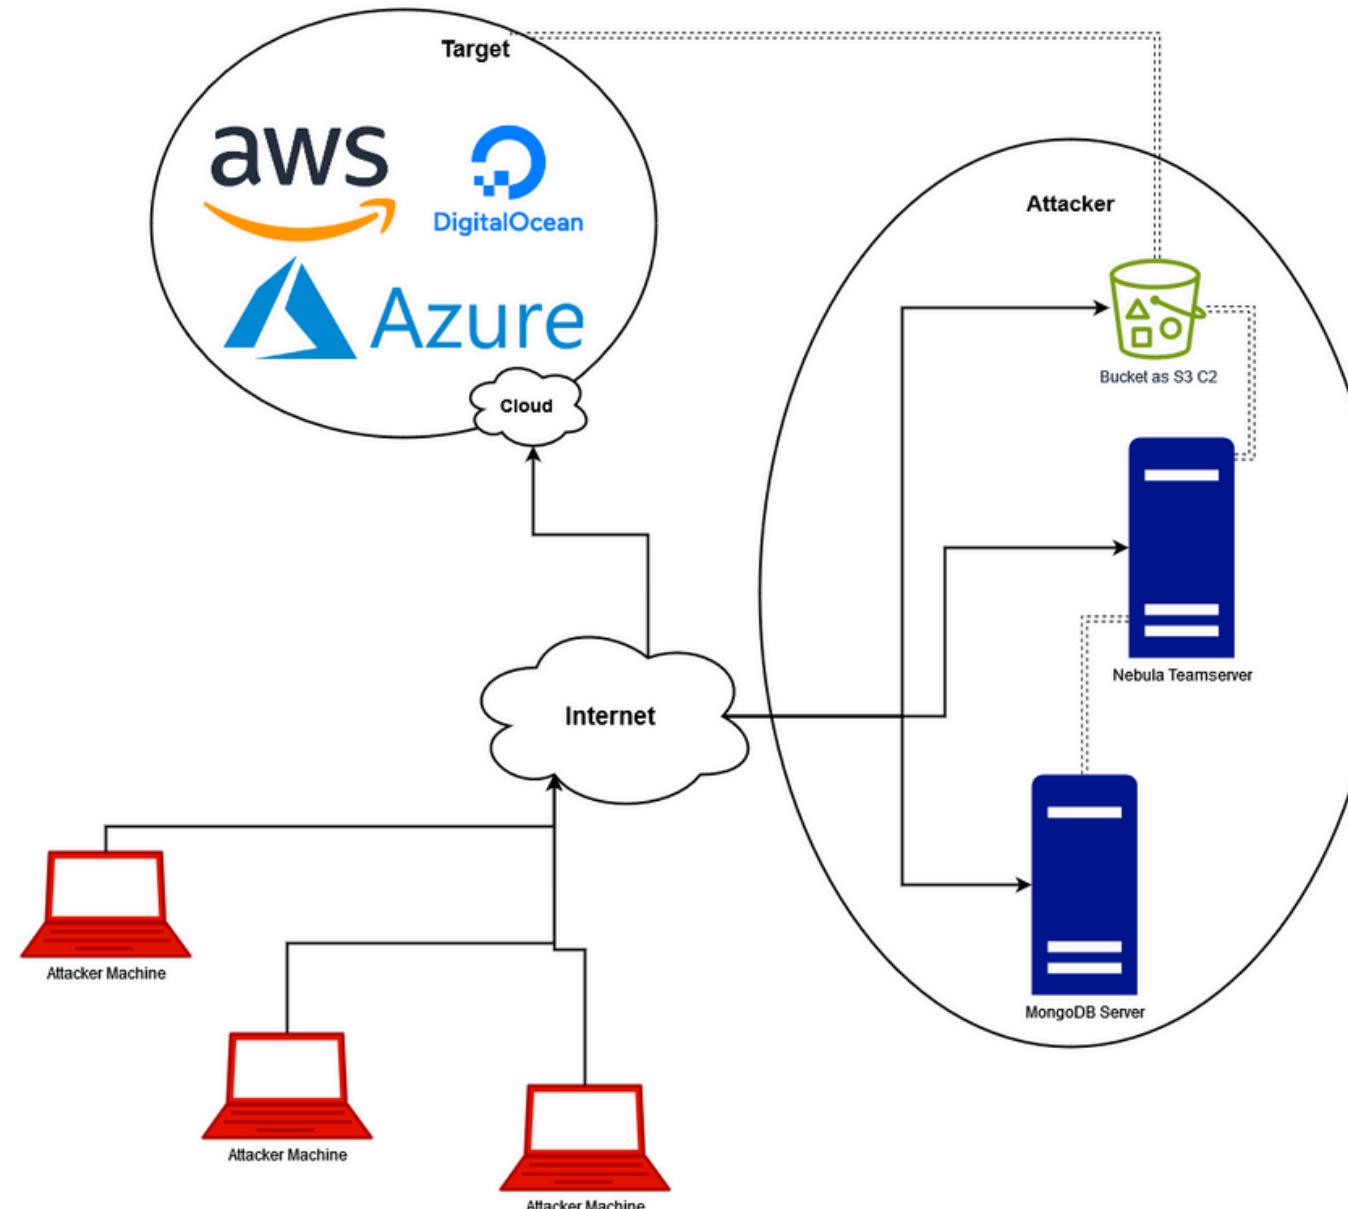

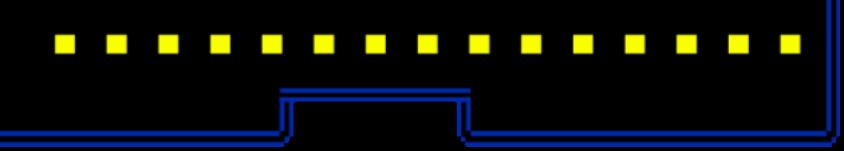

# TEAM SERVER

# CLIENT

# TOOL ARCHITECTURE

# INSTALLATION

Just build the container  
for both teamserver and  
client

```
$ docker build -t nebula-teamserver .
```

Then, just run it using docker:

```
$ docker run -it nebula-teamserver -dH <database host> -du <database user> -dp <database password> -dn
-----
[REDACTED]
-----
37 aws      0 gcp      4 azure      0 office365

help user-agent                            Show help for credentials
help shell                                  Show help for shell connections
help info                                    Show help for info commands
help user                                    Show help for cosmonauts

Credential commands
-----
set aws-credentials <cred name>           Insert credentials while providing the name as argument
set do-credentials <cred name>              Insert credentials while providing the name as argument
set azure-credentials <cred name>           Insert credentials while providing the name as argument
use credentials <cred name>                 Use the credentials you want
show credentials                           Show all credentials
show current-creds                         Show credentials you are currently using
remove credentials                          Delete credentials
getuid                                     Get the username, arn, account ID from a set of credentials you have found.
getuid ssmrole                             Check if the SSM Instance Profile is using AmazonEC2RoleforSSM or AmazonSSMManagedInstanceCore

Module Commands
-----
show modules                                List all the modules
use module <module>                         Use a module.
options                                      Show options of a module you have selected.
run                                           Run a module you have selected. Eg: 'run <module name>'
back                                          Unselect a module
set <option>                                Set option of a module. Need to have the module used first.
unset <option>                              Unset option of a module. Need to have the module used first.

User-Agent commands
-----
set user-agent windows                      Set a windows client user agent
set user-agent linux                        Set a linux client user agent
set user-agent custom                       Set a custom client user agent
show user-agent                            Show the current user-agent
unset user-agent                           Use the user agent that boto3 produces

Shell commands
-----
shell exit_particle_shell                   Kill a connection
shell <command>                            Run a command on a system. You don't need " on the command, just shell <command1> <command2>

User commands
-----
create user <user>                         Create a new user to login to the teamserver
reset-password <user>                        Reset the password of a current user
remove user <user>                           Delete a current user

Info commands
-----
list_aws_iam_users                          List all the users enumerated before and stored on the database
get_aws_iam_user <user>                     Get info on a single user provided
list_aws_s3_bucket <user>                   List all buckets enumerated before
get_aws_s3_bucket <bucket>                  Get info on one specific bucket
```

```
(test)()Nebula) >>> help module

Module Commands
-----
show modules                                List all the modules
use module <module>                         Use a module.
options                                      Show options of a module you have selected.
run                                           Run a module you have selected. Eg: 'run <module name>'
back                                          Unselect a module
set <option>                                Set option of a module. Need to have the module used first.
unset <option>                              Unset option of a module. Need to have the module used first.
```

```

# MODULE LIST

Modules	Description
<code>cleanup/aws_guadduty_enable_detector</code>	Enables a GD Detector on a specific region.
<code>cleanup/aws_guadduty_enable_s3_source</code>	Reenabled Guard Duty Data Sources that has been disabled before
<code>cleanup/aws_guadduty_revert_finding_time</code>	Revert the detection time back to the original.
<code>cleanup/aws_s3_delete_bucket</code>	Gets the name of a bucket and deletes it. The bucket policy should allow it.
<code>cleanup/aws_iam_delete_login_profile</code>	Delete access of a user to the Management Console
<code>cleanup/aws_iam_delete_access_key</code>	Delete access key of a user by providing it.
<code>detectionbypass/aws_cloudtrail_stop_logging</code>	Stop a CloudTrail Trail on a specific Region.
<code>detectionbypass/aws_guadduty_update_ip_sets</code>	Disables a GD Detector on a specific region. Mind you, many security systems detect this behaviour.
<code>detectionbypass/aws_guadduty_increase_finding_time</code>	Changes the GD Time to either 1 or 6 hours, giving attackers time to work without detection. Mind you, many security systems detect this behaviour.
<code>detectionbypass/aws_s3_empty_log_bucket</code>	Empty the bucket where CloudTrail Logs are stored.
<code>detectionbypass/aws_cloudtrail_delete_trail</code>	Delete a CloudTrail Trail on a specific Region.
<code>detectionbypass/aws_guadduty_disable_s3_source</code>	Disables S3 as a data source for GD. Mind you, many security systems detect this behaviour.
<code>detectionbypass/aws_guadduty_disable_detector</code>	Disables a GD Detector on a specific region. Mind you, many security systems detect this behaviour.
<code>enum/digitalocean_space_enum_all</code>	Enumerate all Space using Space API
<code>enum/aws_s3_list_bucket_objects</code>	List the objects of a bucket

# RUNNING MODULE

```
(test)()(exploit/aws_create_console_url) >>> options
Description:
-----
  This module is based of aws_consoler from NetSPI. It will run STS:GetFederationToken to create a set of temporary credentials for the user and then try to create a console that allows access even if the user no login profile.

Author:
-----
  blog: https://www.pepperclipp.com/
  github: https://github.com/g14ssesbol

# RECONNAISSANCE

```
(test)()(Nebula) >>> search reconnaissance/
```

Modules	Description
reconnaissance/azuread_unauth_user_enum	
reconnaissance/azure_fuzz_aks_api_server	Gets the name of a basename or a list of basenames separated by comma (',') or a wordlist of the basename and bruteforces the name of the services by sending DNS Requests to them.
reconnaissance/misc_grayhatwarfare	Find open buckets on GrayHatWarFare. The buckets can be Azure, AWS or DigitalOcean buckets. You'll need an access token, so you'll need an account on GrayHatWarFare.
reconnaissance/misc_dns_fuzzing	Get a list of hosts and checks if they exist.
reconnaissance/digitalocean_space_bucket_name_fuzzer	Gets the name of a SPACE or a list of SPACES separated by comma (',') or a wordlist of the SPACE name and bruteforces the name of the SPACE by sending a request to https://<SPACEname>.s3.<region>.amazonaws.com or if it's a website by querying http://<SPACEname>.s3-<region>.amazonaws.com.
reconnaissance/azure_service_dns_fuzzer	Gets the name of a basename or a list of basenames separated by comma (',') or domain and country and generates the wordlist and bruteforces the name of the services by sending DNS Requests to them.
reconnaissance/aws_s3_bucket_name_fuzzer	Gets the name of a bucket or a list of buckets separated by comma (',') or a wordlist of the bucket name and bruteforces the name of the bucket by sending a request to https://<bucketname>.s3.<region>.amazonaws.com or if it's a website by querying http://<bucketname>.s3-<region>.amazonaws.com.
reconnaissance/azure_check_azure_usage	Check if federation is configured for a domain.
reconnaissance/misc_find_ip_category	Checks for subdomains of the domain by enumerating certificates from crt.sh
reconnaissance/misc_crtsh	Checks for subdomains of the domain by enumerating certificates from crt.sh

# ENUMERATION

```
(test)()(privesc/aws_iam_attach_policy_terraform) >>> search enum/
```

Modules	Description
enum/digitalocean_space_enum_all	Enumerate all Space using Space API
enum/aws_s3_list_bucket_objects	List the objects of a bucket
enum/azuread_enum_admin_users	This module will try to get as many information on the user's account on O365, based on the its privileges.
enum/azuread_get_group_members	This module will try to get as many information on the user's account on O365, based on the its privileges.
enum/aws_enum_services_using_cost_explorer	<b>Description of your Module</b>
enum/azuread_get_user_list	This module will try to get as many information on the user's account on O365, based on the its privileges.
enum/digitalocean_space_list_deleted_objects	List the objects of a bucket
enum/aws_iam_enum_iam	Disables a GD Detector on a specific region. Mind you, many security systems detect this behaviour.
enum/digitalocean_enum_all	Enumerate all DigitalOcean Resources
enum/azuread_list_groups	This module will try to get as many information on the user's account on O365, based on the its privileges.
enum/azuread_enum_current_user	This module will try to get as many information on the user's account on O365, based on the its privileges.
enum/azuread_list_mfa_status_for_users	This module will try to get as many information on the user's account on O365, based on the its privileges.
enum/aws_tag_enum_using_get_resources	List all resources on the infrastructure based on the .
enum/azuread_get_user_password_policy	This module will try to get as many information on the user's account on O365, based on the its privileges.
enum/aws_s3_list_deleted_files	Check all the versions of the objects of a bucket or a list of buckets and find deleted files. Then, you can use exploit/aws_s3_get_object to download the files. The module is based of the RedBoto script: aws_s3_list_deleted_files.py
enum/azuread_list_users	This module will try to get as many information on the user's account on O365, based on the its privileges.
enum/azuread_find_groups_with_dynamic_membership	This module will try to get all groups with dynamic membership

# EXPLOITATION

Modules	Description
exploit/aws_create_console_url	This module is based of aws_consoler from NetSPI. It will run STS:GetFederationToken to create a set of temporary credentials for the user and then try to create a console that allows access even if the user no login profile.
exploit/aws_ec2_modify_user_data	Lists User data of an Instance provided. Requires Secret Key and Access Key of an IAM that has access to it.
exploit/aws_ssm_send_command	SendCommands to some InstanceIDs provided, split by comma, or a file of InstanceIDs. Also shows the output of the command if you want to. The APIs used are ssm:SendCommand and ssm:GetCommandInvocation.
exploit/aws_lambda_download_function	Get the source code of a specific function (and/or version) provided.

- exploit/aws\_create\_console\_url
- exploit/aws\_lambda\_download\_function
- exploit/aws\_ssm\_send\_command

- privesc/aws\_iam\_create\_policy\_version\_terraform
- privesc/aws\_iam\_create\_user\_access\_key
- privesc/aws\_iam\_create\_user\_login\_profile
- privesc/aws\_iam\_attach\_policy\_terraform

Modules	Description
privesc/aws_iam_create_user_access_key	Create a 2nd access key to a user. To do this, the user needs to have only one access key. If the user has 2 access keys and OVERRIDE-OLDEST-ACCESS-KEY is set to true, the oldest created access key will be deleted and a new one will be created.
privesc/aws_iam_create_policy_version_terraform	If an IAM user is not allowed to access the Management Console, you can allow it using a password you want.
privesc/aws_iam_create_user_login_profile	If an IAM user is not allowed to access the Management Console, you can allow it using a password you want.
privesc/azuread_add_user_to_group	This module will try to get as many information on the user's account on O365, based on the its privileges.
